Abstract (Basic): DE 3618452 A

The screen heater comprises parallel conductor strips supplied via supply rails and shaped for the desired style of the application. At least two suitable connection points are selected which together with neighbouring earth points on the window surround from terminals for at least two diversity antennae. On these terminals are attached a circuit with suitable transformation and amplification properties whose output forms the antenna connection point for one of the antennae.

If need be, the supply rails are broken at set points, and in the dc feed circuits which allow dc feed and simultaneously form a loss-free high-frequency impedance to earth.

ADVANTAGE - Mean reception quality is good, with low noise.
